That is, you manipulate your data as a series of pixels, no matter the source of your original file. The term raster image refers to any image, including those created by scanning or printing. Photoshop is not a graphics program; it is a digital image processing tool. It contains no vector editing tools, no symbol creation tools, and no different strokes tools. Instead, it has tools for manipulation of raster images that you can use to create new images or enhance existing ones. This tutorial will show you some of the things you can do with Photoshop and help you gain a broad understanding of its capabilities as a raster manipulation tool. Identification of the aspartate binding site of Escherichia coli DNA polymerase I by site-directed mutagenesis. Escherichia coli DNA polymerase I (Pol I) belongs to the Y-family of DNA polymerases and is composed of four subunits: alpha, beta, delta, and epsilon. Recently, using site-directed mutagenesis, we showed that substitution of tyrosine 306 of the alpha subunit of Pol I with cysteine did not affect the catalytic activity, but greatly reduced the affinity for ssDNA. In the present study, to identify the amino acid residue that binds to the 3'-OH group of the incoming deoxynucleotide, we substituted the amino acids in the region that form a "pocket" for the substrate nucleotides in the dNTP-binding site of the alpha subunit by site-directed mutagenesis. Upon tryptophan or phenylalanine substitution at residue 337 in the alpha subunit, the affinity for dAMP, dATP, or dGTP was diminished to half the value of wild-type Pol I. Substitution of asparagine, phenylalanine, or tyrosine for residue 333 in the beta subunit did not alter the affinity for nucleotides. To confirm the importance of these amino acid residues in the alpha subunit, we constructed two mutant proteins, alpha Cys306 and alpha Trp337, in which either cysteine 306 or tryptophan 337 was replaced by alanine. alpha Cys306 exhibited almost no affinity for the nucleotides, while alpha Trp337 had an affinity for dAMP that was almost as high as wild-type Pol I. These results indicate that the amino acid residues corresponding to residue 337 of the alpha subunit in the wild-type Pol I are critical for the specificity of dAMP binding. 13:09:53 +0000 Sprouse, the father of the late star of "The Shining," is frustrated as reports circulate that Jack Nicholson has been replaced by another actor in the upcoming movie version of "The Shining."
